### **“Water governance for a sustainable management”**

The water governance is a set of rules, traditions and processes whereby decisions on management of water resources and services are made. This is further supported by natural human capacity and the resources developed by society. The European Regulation 2020/741 establishes minimum requirements for water reuse, a risk management plan and transparency, among other issues, for the safe use of reclaimed water. Its real impact on the objectives of circular economy will be constrained by water scarcity, crops profitability as well as social approval. Indeed, the later will be crucial for the management success.
